

Scatter plot showing time [MJD] on the x-axis (ranging from 56300 to 57400) versus an unlabeled y-axis. The plot displays two groups of stars, labeled 'i' (purple dots) and 'z' (cyan dots), as indicated by the legend in the top right corner. The data points are clustered into four distinct groups, suggesting periodic behavior or multiple populations. The 'i' group generally shows higher values on the y-axis compared to the 'z' group within each cluster.
