

Scatter plot showing the light curves for four filters: g (purple), r (blue), i (green), and z (orange). The x-axis represents time in Modified Julian Days (MJD), ranging from approximately 5630 to 5740. The y-axis represents flux or magnitude, though it is not explicitly labeled. The plot displays several distinct clusters of data points, indicating different phases or states of the source. A legend in the top right corner identifies the filter colors.
